JOHNNY WONDER

Q. "WHAT IS AN ICEBERG?"

CHRISTOPHER TATE, OF CLEVELAND, OH., WINS A PRIZE FOR THIS QUESTION.

A. If a glacier reaches the sea, its forward edge breaks off, forming huge floating blocks of ice called icebergs. The largest icebergs weigh several million tons. These icebergs tower more than 200 feet above the water. This is only a small part of the whole iceberg. The part below water is about seven times as large as the part above. Icebergs often drift far out to sea before they melt and finally disappear. They are a great danger to ships when they drift into shipping lanes. In the North Atlantic Ocean, the main source of icebergs are the glaciers of Greenland.

You can win a World Almanac if your question is selected. Send your name and age to JOHNNY WONDER, c/o this newspaper, P.O. Box 1290, Santa Cruz, CA 95061.
